

SENRIO INSIGHT COMPATIBILITY

Administration, Monitoring, Sharing, and Security

Formal

Pending

Compatible

The Key to Success in Security?

PLAY WELL WITH OTHERS

No single security tool or service can do it all. The best solutions for your enterprise may come from different sources. Getting those solutions to operate seamlessly together takes work. Senrio Insight was designed to be compatible with as wide a range of different appliances, software, and services as possible. In addition to our RESTful API, we export data in Syslog, CEF, STIX, TAXII, CSV, and other formats widely used in the security industry.

We are a certified RSA/NetWitness Technology Partner, and have formal integration certifications pending from Splunk, HP/ArcSight, and others. Future non-security integrations will include ticketing systems like Jira and similar applications so that issues related to vulnerable devices can be addressed in a formal workflow and in an environment familiar to most developers, engineers, and system administrators.

TRY SENRIO INSIGHT

Gain an elemental level of awareness into all the devices in your enterprise. Understand how those devices operate and communicate. Know when devices behave abnormally or pose an increased risk to enterprise security or personal safety.

Insight deploys as software on your own hardware, in a rack-mountable 1u, or on a micro-appliance. Analyze and store data on your devices in the cloud or on-premise.
